1

Make sure the building is weather tight before installing

2
Let the boards rest for 48hrs prior to installation

3

Check framing spacing - 400mm centers for Studs, 800mm nogs and top and bottom nogs to fix ends. Lack of framing will result in a flexible and wavy board surface.

4

Sheet layout - All edges and board centers must be supported - Sheets to be installed vertically or horizontally. Fixed to nogs & studs for support.
5

Cutting requires mechanical tools. We recommend using a fine tooth carbide tip saw and clean up with orbital or belt sander.
6

Fixing for non-braced walls:

- 40mm panel pins or 6g screws @ 150mm centres plus adhesive daubs @ 300mm on framing down the centre
7

Fixing for Braced walls:

- 6g x 40mm screws as per GS1-N fastening pattern.
- Nail Gun - 50 x 2.8mm galvanized Flat Head Ring Shank Nails

8

Finishing & Surface Coatings
- No finishing required.
